

ENG224

INFORMATION TECHNOLOGY – Part I

2. Operating System Case Study: Linux

2. Operating System Case Study: Linux

Reference

- S.M. Sarwar, R. Koretsky and S.A. Sarwar, *Linux – The Textbook*, Addison Wesley, 1st ed, 2002

Features of modern OS

- To facilitate easy, efficient, fair, orderly, and secure use of resources
 - Provide a user interface
 - Organize files on disk
 - Allocating resource to different users with security control
 - Co-ordinate programs to work with devices and other programs

Case study: Linux

A. Development of Linux

2. Operating System Case Study: Linux

- Before Linux

- In 80's, Microsoft's DOS was the dominated OS for PC
 - single-user, single-process system
- Apple MAC is better, but expensive
- UNIX is much better, but much much expensive.
Only for minicomputer for commercial applications
- People was looking for a UNIX based system, which is cheaper and can run on PC
- Both DOS, MAC and UNIX are **proprietary**, i.e., the source code of **their kernel is protected**
 - No modification is possible without paying high license fees

2. Operating System Case Study: Linux

- GNU project

- Established in 1984 by **Richard Stallman**, who believes that software should be free from restrictions against copying or modification in order to make better and efficient computer programs
- **GNU** is a recursive acronym for “**G**NU's **N**ot **U**nix”
- Aim at developing a complete Unix-like operating system which is free for copying and modification
- Companies make their money by maintaining and distributing the software, e.g. optimally packaging the software with different tools (Redhat, Slackware, Mandrake, SuSE, etc)
- Stallman built the first free GNU C Compiler in 1991. But still, an OS was yet to be developed

2. Operating System Case Study: Linux

- Beginning of Linux

- A famous professor Andrew Tanenbaum developed **Minix**, a simplified version of UNIX that runs on PC
- Minix is for class teaching only. No intention for commercial use
- In Sept 1991, **Linus Torvalds**, a second year student of Computer Science at the University of Helsinki, developed the preliminary kernel of Linux, known as Linux version 0.0.1
- It was put to the Internet and received enormous response from worldwide software developers
- By December came version 0.10. Still Linux was little more than in skeletal form.

- Confrontation and Development
 - Message from Professor Andrew Tanenbaum
 - " I still maintain the point that designing a monolithic kernel in 1991 is a fundamental error. Be thankful you are not my student. You would not get a high grade for such a design :-)" (Andrew Tanenbaum to Linus Torvalds)
 - "Linux is obsolete".
(Remark made by Andrew Tanenbaum)
 - But work went on. Soon more than a hundred people joined the Linux camp. Then thousands. Then hundreds of thousands
 - It was licensed under **GNU General Public License**, thus ensuring that the source codes will be free for all to copy, study and to change.

2. Operating System Case Study: Linux

- Linux Today

- Linux has been used for many computing platforms
 - PC, PDA, Supercomputer,...
- Current kernel version 2.6.13
- Not only character user interface but graphical user interface, thanks to the X-Window technology
- Commercial vendors moved in Linux itself to provide freely distributed code. They make their money by compiling up various software and gathering them in a distributable format
 - Red Hat, Slackware, etc
- Chinese distribution of Linux also appeared in Taiwan and China - CLE, Red Flag Linux

Linux Pros and Cons

- **Advantages** over Windows
 - It's almost free to relatively inexpensive
 - Source code is included
 - Bugs are fixed quickly and help is readily available through the vast support in Internet
 - Linux is more stable than Windows
 - Linux is truly multi-user and multi-tasking
 - **multiuser**: OS that can simultaneously serve a number of users
 - **multitasking**: OS that can simultaneously execute a number of programs
 - Linux runs on equipment that other operating systems consider too underpowered, e.g. 386 systems, PDA, etc

Linux Pros and Cons (Cont)

- **Disadvantages** compared with Windows
 - Isn't as popular as Windows
 - No one commercial company is responsible for Linux
 - Linux is relatively hard to install, learn and use
- Hence currently, Linux is mainly used in commercial applications, **server implementation**
- More than 75% current network servers are developed based on Linux or Unix systems
 - Due to the relatively **high reliability**

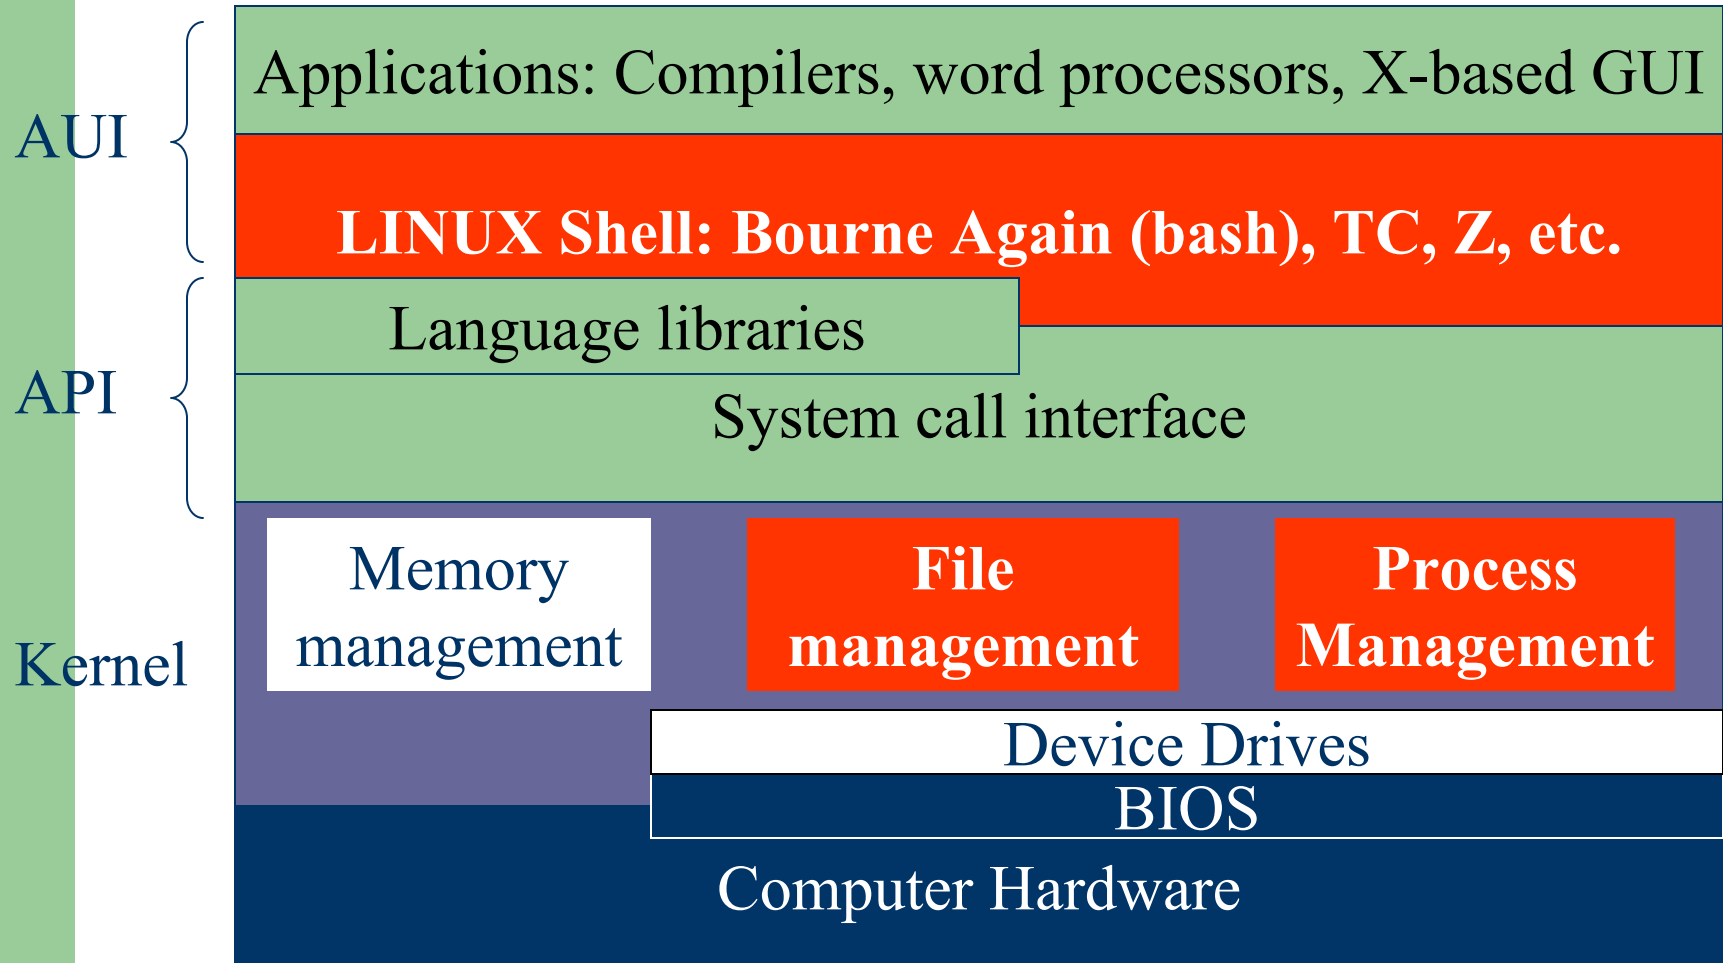

Case study: Linux

B. Linux System Architecture

2. Operating System Case Study: Linux

2. Operating System Case Study: Linux

- Kernel
 - The part of an OS where the real work is done
- System call interface
 - Comprise a set of functions (often known as **A**pplication **P**rogrammer's **I**nterface API) that can be used by the applications and library routines to use the services provided by the kernel
- Application User's Interface
 - Interface between the kernel and user
 - Allow user to make commands to the system
 - Divided into text based and graphical based

2. Operating System Case Study: Linux

- File Management

- Control the creation, removal of files and provide directory maintenance
- For a **multiuser system**, every user should have its own right to access files and directories

- Process Management

- For a **multitask system**, multiple programs can be executed simultaneously in the system
- When a program starts to execute, it becomes a **process**
- The same program executing at two different times will become two different processes
- Kernel manages processes in terms of creating, suspending, and terminating them
- A process is protected from other processes and can communicate with the others

- Memory management
 - Memory in a computer is divided into **main memory** (RAM) and **secondary storage** (usually refer to hard disk)
 - Memory is small in capacity but fast in speed, and hard disk is vice versa
 - Data that are not currently used should be saved to hard disk first, while data that are urgently needed should be retrieved and stored in RAM
 - The mechanism is referred as **memory management**
- Device drivers
 - Interfaces between the kernel and the BIOS
 - Different device has different driver

Case study: Linux

B.1 User interface

Linux User Login

- Linux is a **multiuser OS**
- Allow multiple users to use the resource of a computer at the same time
- Every user needs to **login** the system with the **password** provided to identify their right in using the resource
- Require for both client-server based system or desktop

Linux
Server

Peter Mary Paul

Peter: admin
Paul : general
Mary : intruder
:

Client-server based
system

Linux User Interface

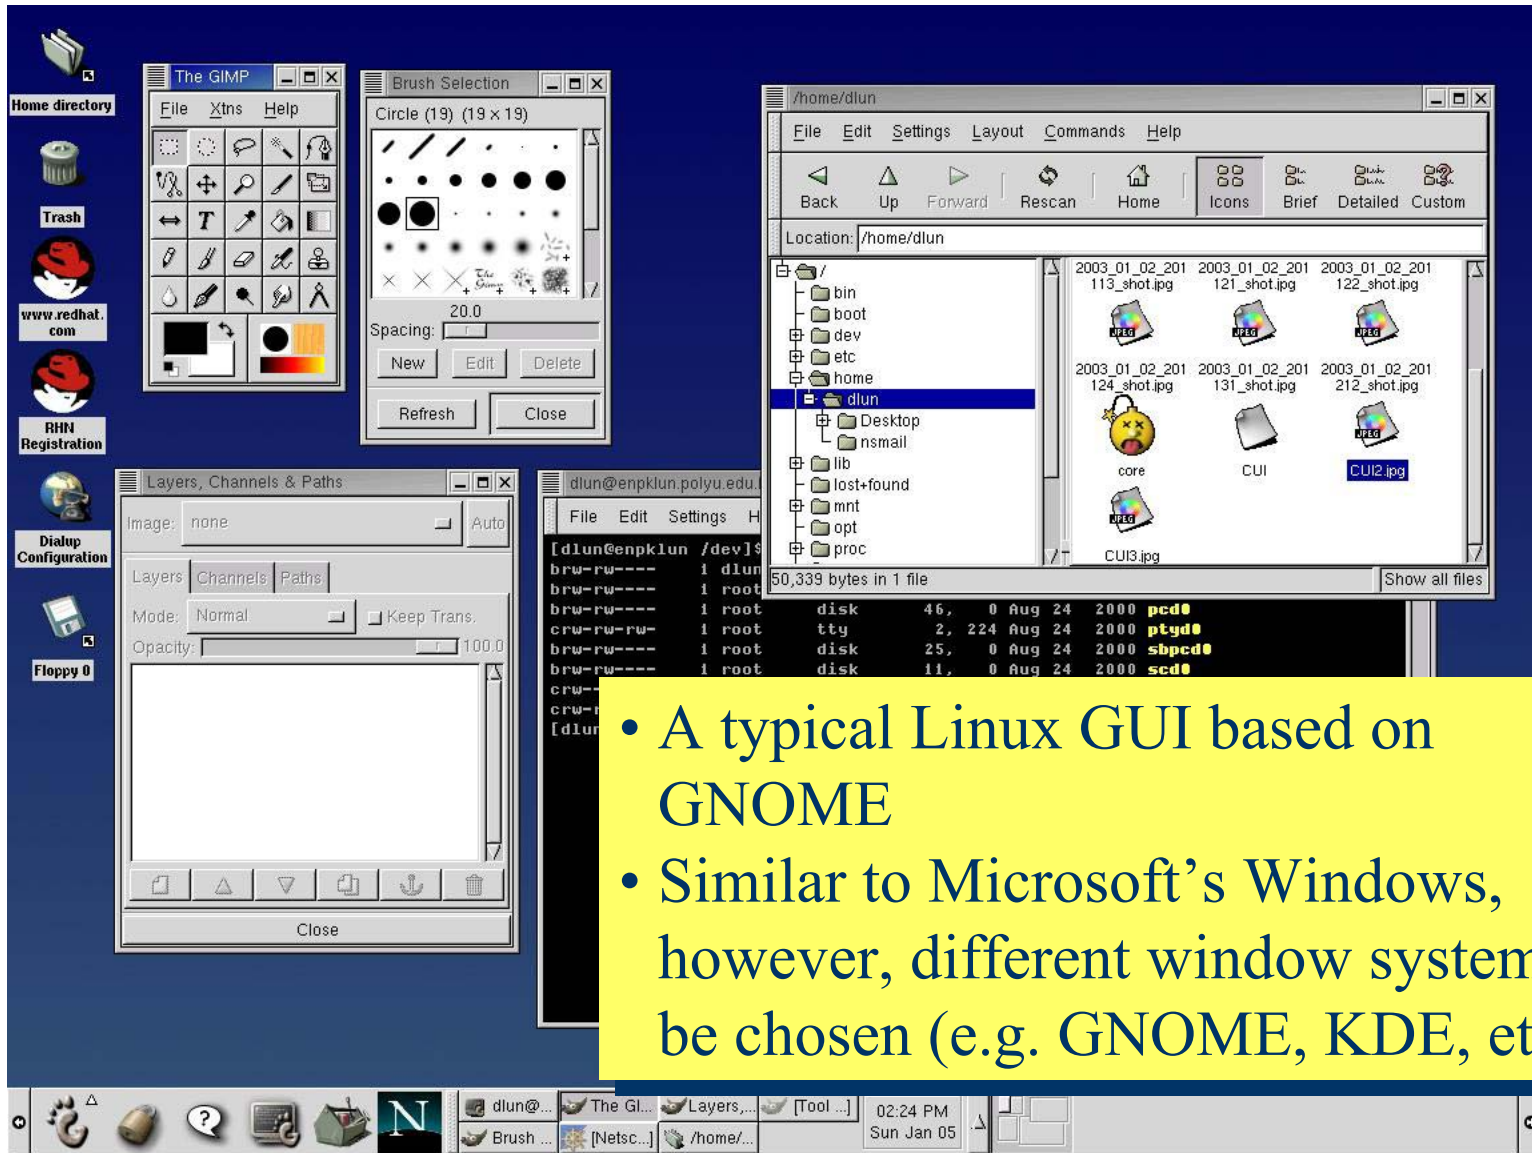

- Traditional Linux (Unix also) uses command-driven interface (or text-based interface)
 - User needs to type lines of command to instruct the computer to work, similar to DOS
 - **Advantage**: fast in speed. Very few resource is required for its implementation
 - **Disadvantages**: user needs to type, hence can easily make error. Besides, user needs to memorize all commands
 - Suitable for expert users and for the systems that interaction with user is not frequent, such as servers

2. Operating System Case Study: Linux

- By adopting the **X-Window technology**, graphical user interface (**GUI**) is available for Linux:
 - Uses pointing devices (e.g. mouse) to control the system, similar to Microsoft's Windows
 - Provide menu-driven and/or icon-driven interfaces
 - **menu-driven**: user is provided with a menu of choices. Each choice refers to a particular task
 - **icon-driven**: tasks are represented by pictures (icon) and shown to user. Click on an icon invokes one task
 - **Advantages**: No need to memorize commands. Always select task from menus or icons
 - **Disadvantages**: Slow and require certain resource for its implementation
 - Suitable for general users and systems, such as PC

2. Operating System Case Study: Linux

2. Operating System Case Study: Linux

Linux text-based interface

The prompt \$ shows that bash shell is using

command to show the content of current directory

command to show the content of current directory with option -al

```

[dlun@enpkun Desktop]$
```

Linux Shell

- **Shell** interprets the command and request service from kernel
- Similar to DOS but DOS has only one set of interface while Linux can select different shell
 - Bourne Again shell (Bash), TC shell (Tcsh), Z shell (Zsh)
- Different shell has similar but different functionality
- **Bash** is the default for Linux
- Graphical user interface of Linux is in fact an application program work on the shell

2. Operating System Case Study: Linux

- Frequently used commands available in most shells:
 - **ls** : to show (**list**) the names of the file in the current directory
 - **cd** : **change directory**,
 - e.g. `cd /` change to the root directory
 - `cd ..` change to the parent of that directory
 - **cp** : **copy** one file to another
 - e.g. `cp abc.txt xyz.txt` copy abc.txt to xyz.txt
 - **rm** : **remove** a file
 - **man** : ask for the **manual** (or help) of a command
 - e.g. `man cd` ask for the manual of the command cd
 - **pwd** : show the name of the **present working directory**
 - **cat** : to show the content of a text file
 - e.g. `cat abc.txt` show the content of abc.txt
 - **whoami** : to show the username of the current user

Case study: Linux

B.2 File management

Linux File Management

- In Linux, file is defined as simply the thing that deals with a sequence of bytes
- Hence **everything are files**
 - An ordinary file is a file; a directory is also file; a network card, a hard disk, any device are also files since they deal with a sequence of bytes
- Linux supports five types of files
 - simple/ordinary file (text file, c++ file, etc)
 - directory
 - symbolic (soft) link
 - special file (device)
 - named pipe (FIFO)

2. Operating System Case Study: Linux

```
dlun@enpklun.polyu.edu.hk: /home/dlun/Desktop
File Edit Settings Help

[dlun@enpklun Desktop]$ ls
Autostart Red Hat Support.kdeInk cdrom.kdeInk
Printer.kdeInk Templates floppy.kdeInk
Red Hat Errata.kdeInk Trash www.redhat.com.kdeInk
[dlun@enpklun Desktop]$
[dlun@enpklun Desktop]$
[dlun@enpklun Desktop]$ ls -al
total 44
drwxr-xr-x  5 dlun  dlun  4096 May 17  2001 .
drwx----- 15 dlun  dlun  4096 Jan  4 15:15 ..
drwxr-xr-x  2 dlun  dlun  4096 May 17  2001 Autostart
-rw-r--r--  1 dlun  dlun  230 May 17  2001 Printer.kdeInk
-rw-r--r--  1 dlun  dlun  159 May 17  2001 Red Hat Errata.kdeInk
-rw-r--r--  1 dlun  dlun  153 May 17  2001 Red Hat Support.kdeInk
drwxr-xr-x  2 dlun  dlun  4096 May 17  2001 Templates
drwxr-xr-x  2 dlun  dlun  4096 May 17  2001 Trash
-rw-r--r--  1 dlun  dlun  388 May 17  2001 cdrom.kdeInk
-rw-r--r--  1 dlun  dlun  395 May 17  2001 floppy.kdeInk
-rw-r--r--  1 dlun  dlun  144 May 17  2001 www.redhat.com.kdeInk
[dlun@enpklun Desktop]$
```

Names in blue are directories, indicated by a letter d at the beginning of the line

2. Operating System Case Study: Linux

- Symbolic (soft) link
 - Not a real file, just a **link** to another file
 - Allow giving another name to a file without actually duplicates it – hence **save memory space**
- Special file (device)
 - Each hardware device, e.g. keyboard, hard disk, CD-ROM, etc is associated with at least one file
 - Usually store in /dev directory
 - Applications can read and write any devices by reading and writing their associate file – hence the access method is known as **device independent**
 - Divide into two types: character special files, e.g. keyboard, and block special files, e.g. disk

2. Operating System Case Study: Linux

Command that sets a symbolic link to a file called CUI to anotherCUI

```
dlun@enpklun.polyu.edu.hk: /home/dlun/Desktop
File Edit Settings Help
[dlun@enpklun Desktop]$ ln -s ../CUI anotherCUI
[dlun@enpklun Desktop]$ ls -al
total 44
drwxr-xr-x  5 dlun  dlun  4096 Jan  4 18:36 .
drwx----- 16 dlun  dlun  4096 Jan  4 18:26 ..
drwxr-xr-x  2 dlun  dlun  4096 May 17 2001 Autostart
-rw-r--r--  1 dlun  dlun  230 May 17 2001 Printer.kdeInk
-rw-r--r--  1 dlun  dlun  159 May 17 2001 Red Hat Errata.kdeInk
-rw-r--r--  1 dlun  dlun  153 May 17 2001 Red Hat Support.kdeInk
drwxr-xr-x  2 dlun  dlun  4096 May 17 2001 Templates
drwxr-xr-x  2 dlun  dlun  4096 May 17 2001 Trash
lrwxrwxrwx  1 dlun  dlun    6 Jan  4 18:36 anotherCUI -> ../CUI
-rw-r--r--  1 dlun  dlun  388 May 17 2001 cdrom.kdeInk
-rw-r--r--  1 dlun  dlun  395 May 17 2001 floppy.kdeInk
-rw-r--r--  1 dlun  dlun  144 May 17 2001 www.redhat.com.kdeInk
[dlun@enpklun Desktop]$
```

File size is only 6 bytes

A symbolic link begins with a letter l

2. Operating System Case Study: Linux

```
dlun@enpkun.polyu.edu.hk: /dev
File Edit Settings Help
[dlun@enpkun /dev]$ ls -al *d0
brw-rw---- 1 dlun floppy 2, 0 Aug 24 2000 fd0
brw-rw---- 1 root disk 9, 0 May 17 2001 md0
brw-rw---- 1 root disk 46, 0 Aug 24 2000 pc0
crw-rw-rw- 1 root tty 2, 224 Aug 24 2000 ptyd0
brw-rw---- 1 root disk 25, 0 Aug 24 2000 sbpcd0
brw-rw---- 1 root disk 11, 0 Aug 24 2000 scd0
crw----- 1 root sys 110, 0 Aug 24 2000 srnd0
crw-rw-rw- 1 root tty 3, 224 Aug 24 2000 ttyd0
[dlun@enpkun /dev]$
```

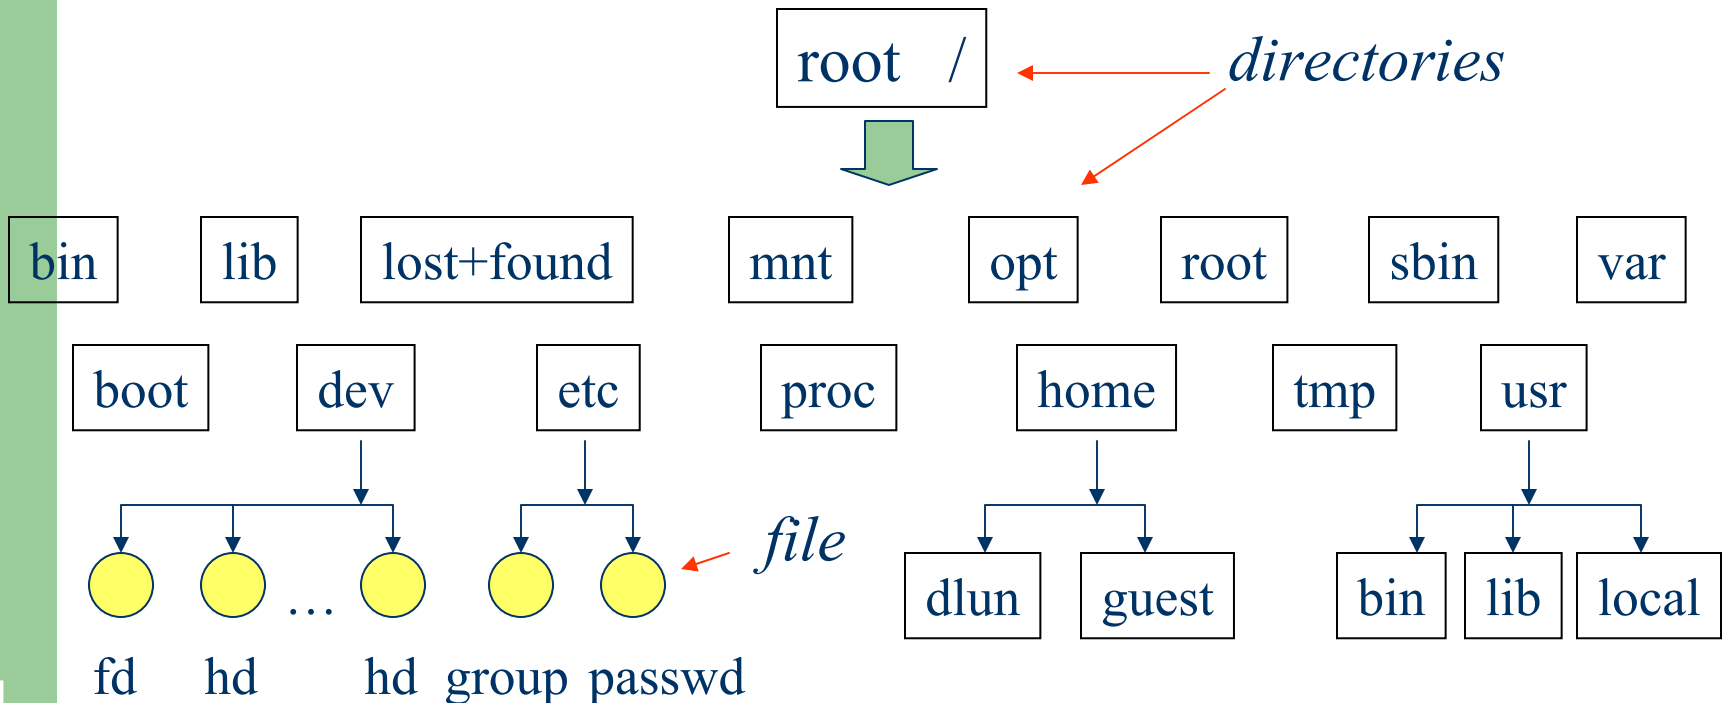

Some are character devices, hence start with a letter c

Some of the special device files in /dev
fd0 – floppy disk
md0 – CD-Rom
Both of them are block devices, hence start with a letter b

Linux File System Structure

- According to the **File System Standard** (FSSTND) proposed in 1994, every LINUX system should contain a set of standard files and directories

2. Operating System Case Study: Linux

- Root Directory (/)
 - Top of the file system. Similar to \ in DOS
- /bin
 - Contain the binary (executable code) of most essential Linux commands, e.g. bash, cat, cp, ln, ls, etc.
- /boot
 - Contain all the files needed to boot the Linux system, including the binary of the Linux kernel. E.g., on Red Hat Linux 6.1, the kernel is in /boot/vmlinux-2.2.5-15 file
- /dev
 - Contain the special files for devices, e.g. fd0, hd0, etc.

2. Operating System Case Study: Linux

- /etc
 - Contain host-specific files and directories, e.g. information about system configuration
 - /etc/passwd
 - This file contains login information of users in the system
 - For every user, one line of record is stored in the following format:

```
login_name : dummy_or_encrypted_password : user_ID :  
group_ID : user_info : home_directory : login_shell
```

2. Operating System Case Study: Linux

- E.g. davis:x:134:105:James A Davis:/home/davis:/bin/bash
 - **davis** : login name
 - **x** : means that it is a dummy password. The encrypted password is stored in /etc/shadow. This field can also be used to store the actual encrypted password. In any case, the original (unencrypted) password cannot be seen by anyone, including the administrator
 - **134** : a user id given to that user. Range from 0 to 65535. 0 is assigned to super-user. 1 to 99 are reserved
 - **105** : a group id given to that user to indicate which group he belongs to. Range from 0 to 65535. 0 to 99 reserved
 - **James A Davis** : user info, usually user's full name
 - **/home/davis** : home directory of the user
 - **/bin/bash** : the location of the shell the user is using

2. Operating System Case Study: Linux

- /home
 - Contain the **home directories of every user** in the system, e.g. dlun, guest, etc
- /lib
 - Store all **essential libraries** for different language compilers
- /lost+found
 - Contain all the files on the system **not connected to any directory.**
 - System administrator should determine the fate of the files in this directory

2. Operating System Case Study: Linux

- /mnt

- Use by system administrator to mount file systems temporarily by using the mount command
- Before using any devices, they have to be **mounted** to the system for registration
- For example, **after mounting a CD-ROM**, the file system in it will be **mapped to /mnt/cdrom directory**
- User can then read and write files in the CD-ROM by accessing this directory
- **Similar to mapping a drive letter to a CD-ROM in Windows**
- Different from the special file in /dev. Special file is only a place where data of the CD-ROM is transferred or stored. No file system concept

2. Operating System Case Study: Linux

- /opt
 - Use to install add-on software packages, e.g. star office, etc.
- /proc
 - Contain process and system information
- /root
 - Home directory of the user root, usually the administrator
- /sbin
 - The directories /sbin, /usr/sbin, and /usr/local/sbin contain **system administration tools, utilities and general root only commands**, such as halt, reboot and shutdown

2. Operating System Case Study: Linux

- /tmp
 - Contain **temporary files**. Usually files in this directory will be deleted from time to time to avoid the system fills with temp files
- /usr
 - One of the largest sections of the Linux file system
 - Contain **read-only data that are shared between various users**, e.g. the manual pages needed for the command man. Stored in /usr/man directory
- /var
 - Contain **data that keeps on changing** as the system is running. E.g. /var/spool/mail directory keeps the mail of user

Linux File Access Privilege

- Linux is a multiuser system, the files of all users are stored in a single file structure
- Mechanism is required to restrict one user to access the files of another user, if he is not supposed to
- User can impose **access permission** to each file to restrict its access
- The term “access permission” refers to
 - read permission
 - write permission
 - execute permission

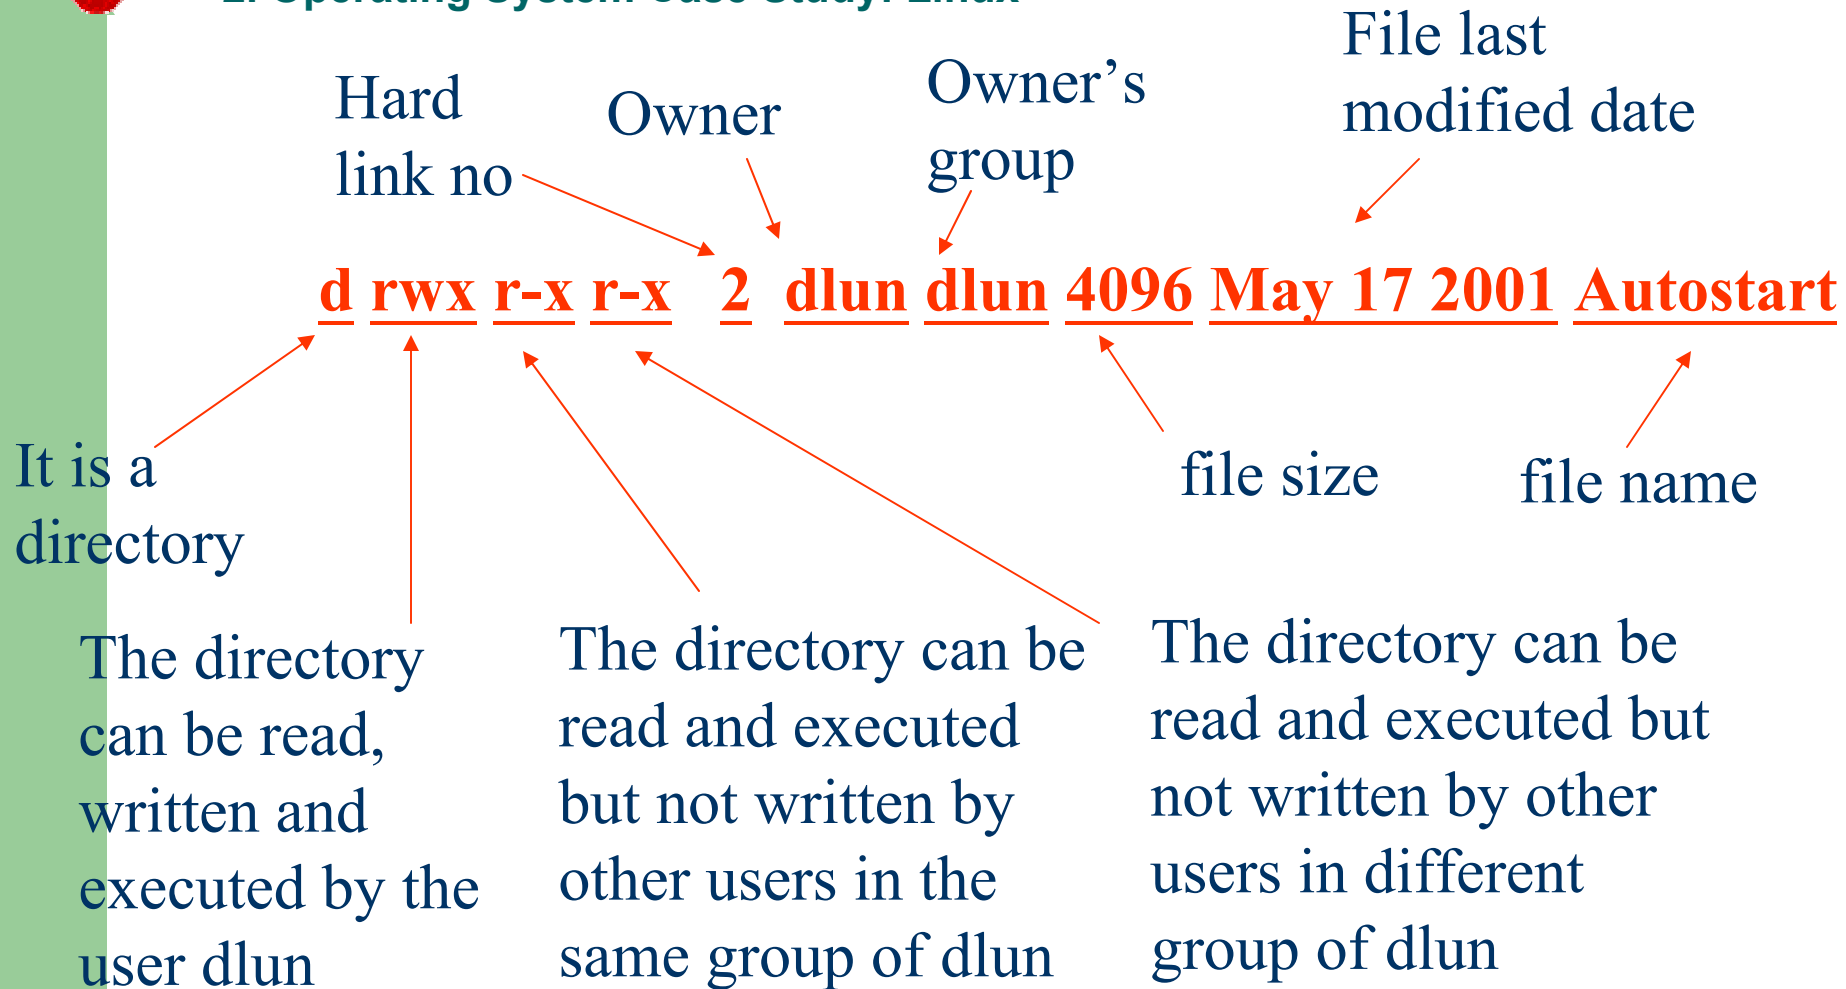

2. Operating System Case Study: Linux

```
dlun@enpk1un.polyu.edu.hk: /home/dlun/Desktop
File Edit Settings Help
[dlun@enpk1un Desktop]$ ln -s ../CUI anotherCUI
[dlun@enpk1un Desktop]$ ls -al
total 44
drwxr-xr-x  5 dlun  dlun  4096 Jan  4 18:36 .
drwx----- 16 dlun  dlun  4096 Jan  4 18:26 ..
drwxr-xr-x  2 dlun  dlun  4096 May 17  2001 Autostart
-rw-r--r--  1 dlun  dlun   230 May 17  2001 Printer.kdeInk
-rw-r--r--  1 dlun  dlun   159 May 17  2001 Red Hat Errata.kdeInk
-rw-r--r--  1 dlun  dlun   153 May 17  2001 Red Hat Support.kdeInk
drwxr-xr-x  2 dlun  dlun  4096 May 17  2001 Templates
drwxr-xr-x  2 dlun  dlun  4096 May 17  2001 Trash
lrwxrwxrwx  1 dlun  dlun    6 Jan  4 18:36 anotherCUI -> ../CUI
-rw-r--r--  1 dlun  dlun   388 May 17  2001 cdrom.kdeInk
-rw-r--r--  1 dlun  dlun   395 May 17  2001 floppy.kdeInk
-rw-r--r--  1 dlun  dlun   144 May 17  2001 www.redhat.com.kdeInk
[dlun@enpk1un Desktop]$
```

The file access permission can be seen by using the command `ls -l` or `ls -al`

2. Operating System Case Study: Linux

The group of a user is assigned by the administrator when a user is added to the system

2. Operating System Case Study: Linux

- Access permission can also be assigned to a directory
- **Directory is also a file** that contains the attributes of the files inside it
- If **read permission** is not given to a directory
 - cannot show the structure of this directory
 - e.g. cannot use ls
- If **write permission** is not given to a directory
 - cannot modify anything of the directory structure
 - e.g. cannot copy a file into this directory since it will modify the directory structure by adding one more file
- If **execute permission** is not given to a directory
 - nearly nothing can be done with this directory, even cd

- The access permission of a file or directory can be changed by using the command

chmod xyz filename/directory name

- xyz refers 3 digit in octal form
- E.g.

660	:	110	110	000
	⇒	rw-	rw-	---
545	:	101	100	101
	⇒	r-x	r--	r-x

2. Operating System Case Study: Linux

dlun@enpklun.polyu.edu.hk: /home/dlun/Desktop/test/temp

File Edit Settings Help

temp does not have execution right

```
[dlun@enpklun test]$ ls -l
total 12
-rw-r--r--  1 dlun    dlun      395 Jan  7 16:36 floppy.kdeInk
drw-----  2 dlun    dlun    4096 Jan  9 11:06 temp
-rw-rw-r--  1 dlun    dlun     16 Jan  7 16:05 test1.txt
```

even cd is not workable

```
[dlun@enpklun test]$
[dlun@enpklun test]$
[dlun@enpklun test]$ cd temp
bash: cd: temp: Permission denied
```

execution right is added

```
[dlun@enpklun test]$
[dlun@enpklun test]$
[dlun@enpklun test]$ chmod 700 temp
[dlun@enpklun test]$
[dlun@enpklun test]$ ls -l
total 12
-rw-r--r--  1 dlun    dlun      395 Jan  7 16:36 floppy.kdeInk
drwx-----  2 dlun    dlun    4096 Jan  9 11:06 temp
-rw-rw-r--  1 dlun    dlun     16 Jan  7 16:05 test1.txt
[dlun@enpklun test]$ cd temp
[dlun@enpklun temp]$
```

now we can change the directory to temp

File Storage in Linux

- Data storage on hard disk
 - Data in a hard disk are stored on a magnetic flat plate
 - Disk's surface needs to be partitioned and labeled so that computer can go directly to a specific point on it
 - Achieve by low level **formatting** the disk
 - Create magnetic concentric circles called **tracks**
 - Each track is split into smaller parts called **sectors** and numbered
- Each sector: hold 512 bytes data
 - E.g. 80 tracks (from outer to inner 0 .. 79), 18 sectors disk can store $80 \times 18 \times 512$ bytes data.

Formatted Disk

Sector

Track

Density of data is
higher for inner tracks
than outer tracks

©2001 How Stuff Works

2. Operating System Case Study: Linux

- Must read or write whole sector at a time
- OS allocates groups of sectors called cluster to files
- Files smaller than the cluster will still be allocated the whole cluster, but the rest left unused
- In Linux, every file is associated with an **inode** that records its location in the disk
- The inode of all files are put together in a data structure called **inode table**
- In the **directory**, every file is associated with a **inode number** that points to an entry of the inode table

Case study: Linux

B.3 Process management

Linux Process Management

- Linux is a **multitasking** system
- Multiple programs can be executed at the same time
- Ultimately, a program needs to be executed by a CPU
- If there is only one CPU, how multiple programs can be executed at the same time?
 - ⇒ By **time sharing**
- That is, all programs are claimed to be executing. In fact, most of them are **waiting** for the CPU

- A program that is claimed to be executing is called a **process**
- For a multitasking system, a process has at least the following three **states**:

- Ready state
 - All processes that are ready to execute but **without the CPU** are at the ready state
 - If there is only 1 CPU in the system, all processes except one are at the ready state
- Running state
 - The process that **actually possesses the CPU** is at the running state
 - If there is only 1 CPU in the system, at most there is only one process is at the running state
- Sleeping state
 - The process that is **waiting for other resources**, e.g. I/O, is at the sleeping state

2. Operating System Case Study: Linux

- Processes will alternatively get into the CPU one after the other (called the **round robin scheme**)
- A process will be “in” a CPU for a very short time (**quantum**)
 - For Linux, each quantum is about 100msec
- At the time that a process is selected to be “in” the CPU
 - It goes from **ready state to running state**
- After that, it will be swapped out
 - It goes from **running state back to ready state**
- Or it may due to the waiting of an I/O device, e.g. mouse
 - It goes from **running state to sleeping state**
- When obtaining the required resource
 - It goes from **sleeping state to ready state**

2. Operating System Case Study: Linux

- The mechanism to determine which process should “get into” the CPU is called **Process scheduling**
- For example,

Program A

Actual sequence of operations

Actual sequence of operations

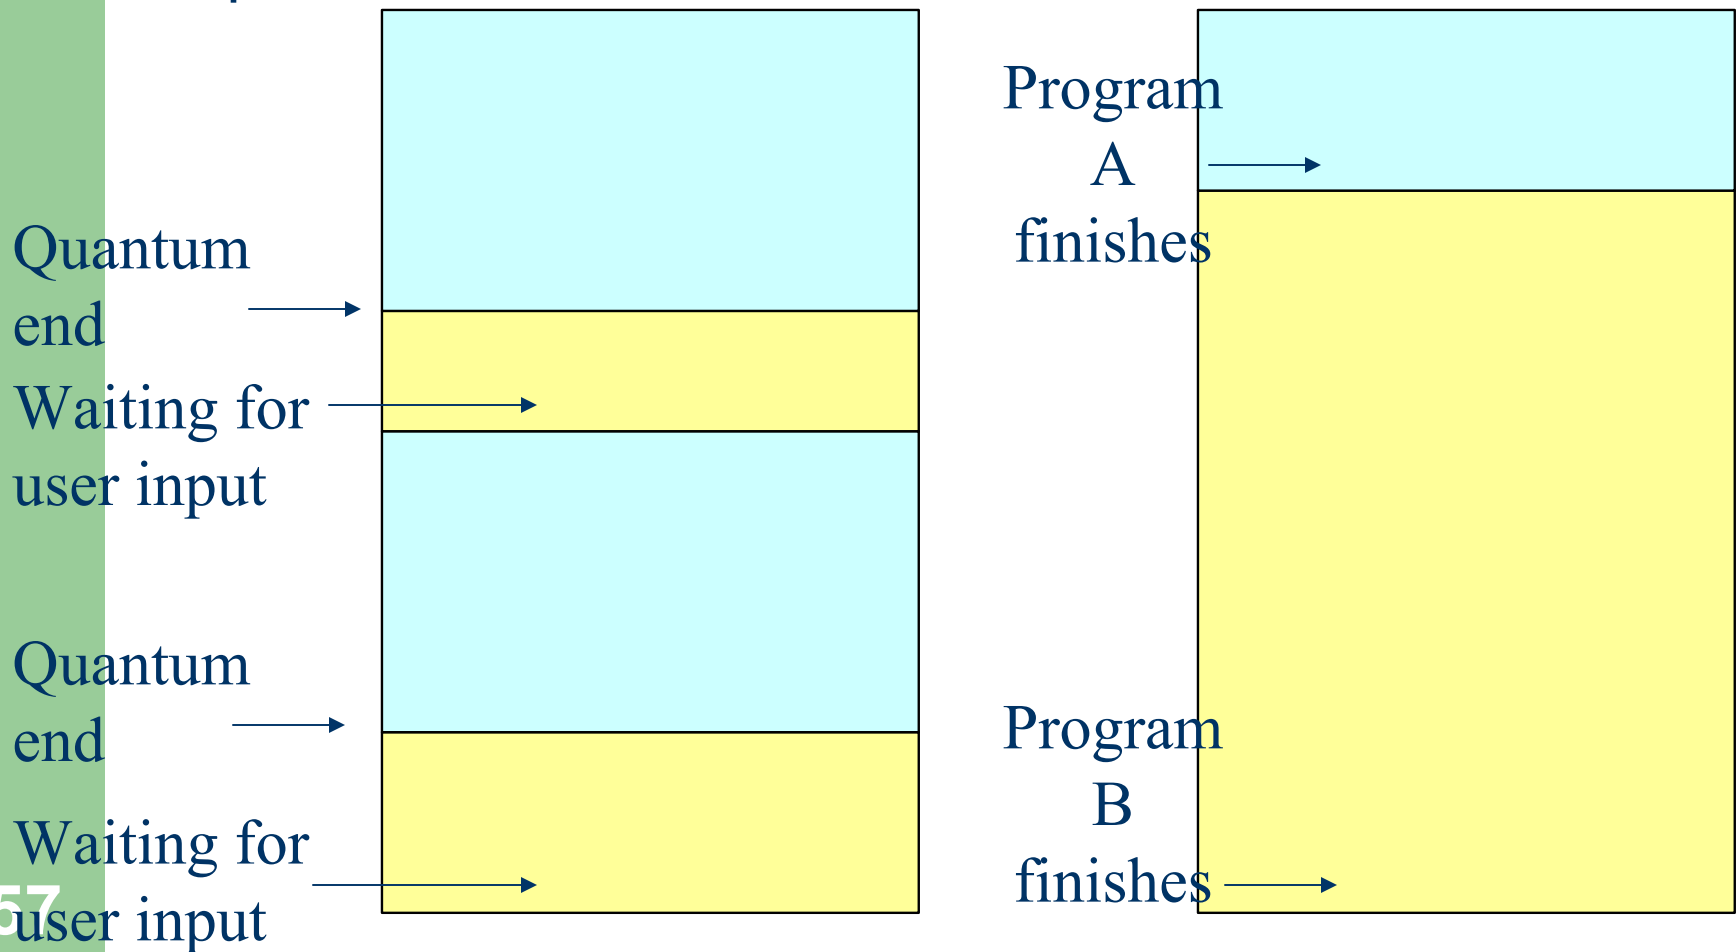

Program B

2. Operating System Case Study: Linux

- Program A and B will be at the running state alternatively, depends on the quantum size and the availability of the required resource

2. Operating System Case Study: Linux

Terminal pts/0 has the editor **vi** running

Terminal pts/1 is executing **ps** to see the processes of both terminals

```
dlun@enpkun.polyu.edu.hk: /home/dlun/Desktop
File Edit Settings Help
It is a test.
It is another test.

File Edit Settings Help
[dlun@enpkun dlun]$ ps -t pts/0,pts/1 a
  PID TTY          STAT       TIME COMMAND
 14748 pts/1        S           0:00 -bash
 14795 pts/0        S           0:00 -bash
 14874 pts/0        S           0:00 vi test1.txt
 14876 pts/1        R           0:00 ps -t pts/0,pts/1
[dlun@enpkun dlun]$
```

The processes of a system can be seen by using the command **ps**

2. Operating System Case Study: Linux

PID	TTY	STAT	TIME	COMMAND
14748	pts/1	S	0:00	-bash
14795	pts/0	S	0:00	-bash
14974	pts/0	S	0:00	vi test1.txt
14876	pts/1	R	0:00	ps ...

Process ID

Terminal
name

State:

S – Sleeping
(waiting for input)

R – Running

How much time the
process is continuously
executing

2. Operating System Case Study: Linux

- For the example above, both bash processes, which are the shell of both terminals, are waiting for the input of user. They must be in the **sleeping state**
- The vi process, which is an editor, is also waiting for the input of user. Hence it is also in **sleeping state**
- When ps reporting the processes in the system, it is the only process that is running. Hence it is in **running state**

2. Operating System Case Study: Linux

- A process can be forced to terminate by using the command **kill -9 PID**

```
dlun@enpklun.polyu.edu.hk: /home/dlun
File Edit Settings Help
[dlun@enpklun dlun]$ ps -t pts/0,pts/1 a
  PID TTY          STAT       TIME COMMAND
 14748 pts/1        S           0:00 -bash
 14795 pts/0        S           0:00 -bash
 14874 pts/0        S           0:00 vi test1.txt
 14876 pts/1        R           0:00 ps -t pts/0,pts/1 a
[dlun@enpklun dlun]$
[dlun@enpklun dlun]$
[dlun@enpklun dlun]$ kill -9 14874
[dlun@enpklun dlun]$ ps -t pts/0,pts/1 a
  PID TTY          STAT       TIME COMMAND
 14748 pts/1        S           0:00 -bash
 14795 pts/0        S           0:00 -bash
 14891 pts/1        R           0:00 ps -t pts/0,pts/1 a
[dlun@enpklun dlun]$
```

The vi process is terminated by using the command
kill -9 14874
